Task 1: HTML Structure and Basic Server Interaction

Intern: Vrushali Nathjogi

Technology Used: HTML, CSS, Node.js, Express.js, EJS

1. Objective

The objective of this task was to understand basic server-side rendering and form submission using Node.js, Express.js, and EJS.

2. Project Description

A simple **Student Registration System** was developed. The application contains a registration form that accepts the student's name, email, mobile number, and course.

When the user submits the form, the data is sent to the Express.js server through a POST request. The server processes the submitted information and passes it to an EJS template, which dynamically displays the registration details.

3. Implementation

The project was developed using the following components:

- **HTML/EJS:** Created the registration form and result page.
- **CSS:** Designed the user interface.
- **Node.js:** Used as the server-side runtime environment.
- **Express.js:** Created the server and handled GET and POST requests.
- **EJS:** Used for server-side rendering and displaying dynamic data.

4. Working Flow

User → Registration Form → POST Request → Express Server → EJS Template → Dynamic Result Page

5. Result

The application successfully accepts student information through the registration form and displays the submitted details dynamically on the result page.

6. Learning Outcome

This task provided practical understanding of:

- Creating forms using HTML
- Setting up a Node.js server
- Using Express.js for routing
- Handling POST requests
- Processing form data
- Using EJS for server-side rendering
- Connecting frontend forms with backend logic

7. Conclusion

Task 1 was successfully completed and tested. The project demonstrates basic full-stack interaction between a frontend form and an Express.js backend with EJS-based server-side rendering.
